electrical

Electricians specialize in the installation, operation, repair and maintenance of electrical systems, including wiring, circuit boards and electronics. They install and maintain the power systems for our homes, businesses and institutions. Construction electricians read blueprints and install and connect wires to circuit breakers, transformers, outlets or other components and systems while maintenance electricians repair or replace electric and electronic equipment.

Consumers and businesses alike depend upon electricians to safely and efficiently supply power to their homes and businesses. The field offers variety – no two days on the job will bring the same tasks or challenges. Those with a careful eye for detail, good work habits and great work judgment might consider becoming electricians.

As a trained electrician, you can work anywhere in the world and choose your work environment – industrial plants, private businesses, residential maintenance or new construction. Salaries vary by geographic region, type of work and degree of responsibility. Manufacturing, engineering, packaging, power generation, utility companies, oil refineries and green power are just a few of the places where electricians go to work.
