hvac/r

Heating and air conditioning systems control the temperature, humidity and air quality in homes, businesses, industrial plants, data centers and other settings. Refrigeration makes it possible to store and transport food, medication and other perishable items. HVAC/R technicians maintain, diagnose and correct problems in heating, cooling and refrigeration systems. The implementation of green technology is creating new opportunities in this industry.

Although we often take them for granted, we depend upon HVAC/R technicians to keep our homes, schools and work environments warm in the winter and cool in the summer. If you are mechanically inclined and enjoy hands-on work, this field offers challenges and variety. HVAC/R careers provide you with job security, a competitive salary, stable employment and opportunities for advancement.

With a career in HVAC/R, you can work in rural areas and large cities in a variety of settings. Salaries vary by geographic region, type of work and degree of responsibility. Technicians work around the world and are needed in offices, private homes, factories, hospitals, sports arenas, shopping malls and supermarkets.
