information technology

Everywhere you go and everything you do is directly or indirectly affected by communications. Communications technicians have the technical skills needed to work in all areas of modern communication such as computers, telephones and wireless devices. They design, implement, troubleshoot and maintain the systems and equipment that enables us to communicate effectively.

The world is becoming increasingly dependent on information and communication systems and the internet. Imagine a grocery store with no computers, scanners, credit card machines, telephones, surveillance or paging systems. The field is diversified and offers several areas for specialization and opportunities to obtain valuable industry certifications.

Communications technicians work everywhere there is a need to communicate. Salaries vary by geographic region, type of work and degree of responsibility. Telephone and cellular companies, IT departments, internet service providers, interconnect companies, data cabling installers, network engineers and alarm and security system companies are just a few examples of specific industries that hire communication technicians.
